

Winter HW-3

1. Given, $P(1) = P(2) = P(3) = P(4) = \frac{1}{5}$ &
 $P(5) = P(6) = \frac{1}{10}$ for loaded die & $P(i) = \frac{1}{6}$
 for fair die

(a) Drawing a Bayes Table

	Prior	Likelihood - $P(D H)$	$P(D H)P(H)$	Posterior - $P(H D)$
H_1	$\frac{1}{2}$	$\frac{1}{6}$	$\frac{1}{12}$	$\frac{1}{12} \times \frac{60}{6} = \frac{5}{8}$
H_2	$\frac{1}{2}$	$\frac{1}{10}$	$\frac{1}{20}$	$\frac{1}{20} \times \frac{60}{8} = \frac{3}{8}$

where H_1 = choosing a fair die, H_2 = choosing a loaded die

$$\therefore P(H_2|D) = P(\text{loaded die} | \text{getting a 6}) = \frac{3}{8} \text{ (Ans)}$$

- (b) Let D = getting a 2 & H_1 = fair die &
 H_2 = getting a loaded die

	Prior	Likelihood - $P(D H)$	$P(D H)P(H)$	Posterior - $P(H D)$
H_1	$\frac{1}{2}$	$\frac{1}{6}$	$\frac{1}{12}$	$\frac{5}{11}$
H_2	$\frac{1}{2}$	$\frac{1}{5}$	$\frac{1}{10}$	$\frac{6}{11}$

$$\therefore P(H_2|D) = P(\text{getting a loaded die} | \text{getting a 2})$$

$$= \frac{6}{11}$$

12

2. Now, given that we have 3 cards with properties like:

- ① Both sides are green.
- ② Both sides are red.
- ③ One side is red & one side is green.

Let A = event that drawn card shows red on upper side. Let E_1, E_2, E_3 be events of having a totally red card, a totally green card & a card with red color on the other side and green color on another side.

$$P(A/E_1) = 1, P(A/E_2) = 0, P(A/E_3) = \frac{1}{2} \quad \text{[By Bayes Theorem]}$$

$$P(E_1/A) = \frac{P(E_1) \times P(A/E_1)}{P(E_1) \cdot P(A/E_1) + P(E_2) \cdot P(A/E_2) + P(E_3) \cdot P(A/E_3)}$$

$$= \frac{\frac{1}{3} \times 1}{\frac{1}{3} \times 1 + \frac{1}{3} \times 0 + \frac{1}{3} \times \frac{1}{2}} = \frac{\frac{1}{3}}{\frac{1}{3} + \frac{1}{6}} = \frac{\frac{1}{3}}{\frac{2+1}{6}} = \frac{\frac{1}{3}}{\frac{3}{6}} = \frac{1}{3} \times \frac{2}{1} = \frac{2}{3}$$

$$\begin{aligned} &= \frac{\frac{1}{3} \times 1}{\frac{1}{3} \times 1 + \frac{1}{3} \times 0 + \frac{1}{3} \times \frac{1}{2}} = \frac{\frac{1}{3}}{\frac{1}{3} + \frac{1}{6}} = \frac{\frac{1}{3}}{\frac{2+1}{6}} = \frac{\frac{1}{3}}{\frac{3}{6}} = \frac{1}{3} \times \frac{2}{1} = \frac{2}{3} \end{aligned}$$

Hence, $P(\text{getting red color on other side} \mid \text{got a red color}) = \frac{2}{3}$ (Ans)

3. Now, we have 2 bowls -
 Bowl 1 & Bowl 2. Bowl 1 - $\frac{1}{4}$ chocolate &
 $\frac{3}{4}$ Vanilla & Bowl 2 - $\frac{1}{2}$ chocolate & $\frac{1}{2}$ Vanilla.

(a) By treating the 2 cookies as one simultaneous piece of evidence, we get -
 H_1 - Bowl 1, H_2 - Bowl 2 & D - getting 2 chocolate cookies.

	Prior	Likelihood	$P(D H) \cdot P(H)$	Posterior
H_1	$\frac{1}{2}$	$\frac{1}{4} \times \frac{1}{4}$	$\frac{1}{32}$	$\frac{1}{5}$
H_2	$\frac{1}{2}$	$\frac{1}{2} \times \frac{1}{2}$	$\frac{1}{8}$	$\frac{4}{5}$

$$\therefore P(\text{Bowl 1} \mid \text{picking 2 chocolate cookies}) = \frac{1}{5} \text{ \&}$$

$$P(\text{Bowl 2} \mid \text{picking 2 chocolate cookies}) = \frac{4}{5}.$$

(b) Assuming the ^{2 chocolate} cookies are picked one after another,
Posterior probabilities after 1st chocolate cookie

	Prior	Likelihood	$P(D H) \cdot P(H)$	Posterior
H_1	$\frac{1}{2}$	$\frac{1}{4}$	$\frac{1}{8}$	$\frac{1}{3}$
H_2	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{4}$	$\frac{2}{3}$

Now, using posterior probabilities as priors in 2nd row

	Prior	Likelihood	$P(D H) \cdot P(H)$	Posterior
H_1	$\frac{1}{3}$	$\frac{1}{3}$	$\frac{1}{9}$	$\frac{1}{4}$
H_2	$\frac{2}{3}$	$\frac{2}{3}$	$\frac{4}{9}$	$\frac{2}{3}$

4. If we draw a chocolate cookie & a vanilla cookie, then the posterior probabilities are calculated as follows:

D_1 = drawing a chocolate cookie, D_2 = drawing a ~~vanilla~~ vanilla cookie, H_1 = ~~drawing~~ Bowl 1, H_2 = Bowl 2.

For chocolate cookie

	Prior	Likelihood	$P(D_1 H) \cdot P(H)$	Posterior
H_1	$\frac{1}{2}$	$\frac{1}{4}$	$\frac{1}{8}$	$\frac{1}{3}$
H_2	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{4}$	$\frac{2}{3}$

For Vanilla cookie

	Prior	Likelihood	$P(D_2 H) \cdot P(H)$	Posterior
H_1	$\frac{1}{2}$	$\frac{3}{4}$	$\frac{3}{8}$	$\frac{3}{5}$
H_2	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{4}$	$\frac{2}{5}$

I do not think that the order in which the cookies are drawn matters. This is because the no. of cookies is ^{so} large that picking a single cookie ~~is~~ ^{does not} alter the likelihood substantially.
